

26 November 2015 -- “I was on my way home from the school when my bus came under fire,” says 11-year-old Niatou Christy Judicael, who was injured in both legs on 4 November when his bus was shot at with automatic weapons. The recent flare in violence in Bangui, the capital of Central African Republic, has seen an increasing number of wounded children being admitted to Bangui Paediatric Complex, the country’s only functioning health structure still providing specialized care for children.

“We are overwhelmed and often we have 2, even 3, children sharing a bed,” explains Assaye Abel, acting director of the hospital.

With just over 300 beds and only 15 medical doctors, the hospital provides free paediatric services including newborn care, vaccination, intensive care, malnutrition treatments and surgical interventions. Each day 250 patients are admitted to Bangui Paediatric Complex, with the majority suffering from malaria, diarrhoea or malnutrition.

“Because of insecurity, health centres across Bangui are closed at night. All emergency cases come to our hospital while, in my unit, we have only half of the qualified personnel that we need,” says Dr Nganda Bangué Marie-Collette, deputy head of the intensive care unit. “We see lots of children with severe malaria, meningitis and newborn infections”.

Children at risk

Since the beginning of 2014, Central African Republic has been facing recurrent crises that have heavily affected the already-weak health system. A WHO survey in 2014 found that 213 health facilities – 1 in 4 of the country’s facilities – are dysfunctional. Many others are only partially functional.

Lack of health professionals, damaged health facilities and lack of equipment and medicines have left many people without access to basic health care.

About 139 children out of every 1000 live births die before their 5th birthday. In Central African Republic, there are only 250 medical doctors, that is 1 doctor per 20 000 people, almost 4 times less than the African average.

In 2014, only 41% of babies less than 12 months old completed their routine vaccination, resulting in repeated outbreaks of measles in different areas of the country.

Funding gaps

The same WHO survey found that only half of secondary health facilities are able to provide emergency trauma care and less than half of all health staff are community health workers without any consistent training.

Youngest victims of the health crisis in Central African Republic

“Half of all functioning health facilities in the country are supported by a humanitarian partner, meaning that the health sector is extremely dependent on external funding,” explains Dr Michel Yao, WHO Representative in Central African Republic. “Current funding gaps may leave hundreds of thousands of people without health care.”

Due to lack of resources and skills, WHO is filling the gap with 3 field offices and is planning 2 more. These teams have been crucial in detecting and responding to disease outbreaks. Since the beginning of the crisis, WHO has delivered more than 300 tonnes of medical supplies to health facilities and nongovernmental organizations in all parts of Central African Republic.

However the funding gap is enormous. In 2015, health partners in Central African Republic appealed for US\$ 63.2 million but, as of mid-November, less than half of these funds had been received.

“WHO was financially supporting the Bangui Paediatric Complex but we had to stop the project 6 months ago due to the lack of funding,” says Dr Yao.

“Our government does what it can but we still need external support and we are thankful to all humanitarian organizations working with us,” concludes Mr Abel of the Bangui Paediatric Complex, that is currently supported by Action Contre la Faim, Italian organization Emergency, Médecins Sans Frontières, UNICEF and WHO.
