

22 August 2016 | GENEVA - A WHO emergency health team arrived 19 August 2016 in Maiduguri State to assess and respond to the health needs of 800 000 people in north eastern Nigeria, formerly held by militant insurgency groups. WHO is scaling up its emergency response activities, together with partners, to assist hundreds of thousands of people in desperate need of health services. More than half of the health facilities in Borno State, the area most severely affected, are not functioning.

Initial assessments reveal urgent health problems among the population in 15 local government areas (LGAs) formerly held by insurgency groups. Estimated mortality rates in some of the areas are 4 times higher than emergency thresholds. The rate of severe acute malnutrition is estimated to be 14%. In addition, Nigeria last week reported two polio cases in Borno state, two years after the last recorded case in the country. One of the cases is from an LGA that is still inaccessible to health service delivery, while the other is from a newly accessible LGA. Measles cases have also been reported in the area, further complicating a challenging humanitarian environment.

The immediate goal of WHO and its partners is to urgently reduce the rates of death and disease by rapidly scaling up life-saving health services. The Organization will work closely with local officials and specialist agencies to address the health risks posed by malnutrition, disease outbreaks and long-term lack of access to basic health services.

The working environment in the affected areas is extremely challenging. Resources and capacities to meet the enormous health service gaps are grossly inadequate. Insecurity is a major constraint, with a number of recent attacks on humanitarian staff by insurgents. The annual wet season is also peaking and there are forecasts of major floods in the coming weeks. Access to the 15 local government areas require military escort over long distances on poor roads.

Nonetheless, WHO and its partners are taking immediate steps to tackle these issues head-on. WHO has already deployed expert staff to Nigeria for emergency operations, coordination, and data management. Another team is on the ground in Borno State to help with the Polio outbreak response. The government has already launched emergency polio vaccination activities, with support from WHO and partners. The first round of vaccinations will soon be completed, targeting one million children. Subsequent large-scale polio immunization rounds are planned before November. WHO has also dispatched emergency drugs and supplies, while the Organization's emergency operations will be further reinforced by an expanded, experienced response team in coming days.

According to Dr Peter Salama, Executive Director of WHO's Health Emergencies Programme, "Protracted conflict situations, such as seen in northern Nigeria – and the surrounding Lake Chad basin countries of Cameroon, Chad and Niger - are among the greatest threats to health globally. Not only are they associated with the world's highest rates of death among children and pregnant women, they can also be breeding grounds for infectious diseases and outbreaks – but are too often neglected by the international community".

WHO's emergency response is built on the Organization's long-standing work in Nigeria, supporting the delivery of vital health services including immunization; maternal, child and neonatal health; and HIV services. WHO is now scaling up its response with a priority on life-saving health care, especially disease control, child health and maternal health. Funding needs for the health sector in Nigeria are estimated at \$25 million as part of the overall 2016 Humanitarian Response Plan which is currently being reviewed with partners in light of the latest events.
