## **Virtual Event For June 17, 11AM EDT. New JAMA study answers whether COVID-19 vaccines can impact male fertility**

Ranjith Ramasamy, M.D., reproductive fertility expert at urologist from the University of Miami Health System, will discuss the findings of him and his team's latest study published in the Journal of the American Medical Association (JAMA) that finally answers whether COVID-19 vaccines have any impact on male fertility.

Dr. Ramasamy and his team have also recently published studies that found the COVID-19 virus can live in penile tissue for up to 7 months post infection and cause erectile dysfunction (See [Newswise release here](#)); as well as in the testicles, which has implications for fertility and potential sexual transmission ( [See Newswise release here](#) ).

Join us for an in-depth discussion on these latest findings that address vaccine hesitancy and more.
